

Discontinuance S64.2 DN160-400 with Pressure Controller PM-4 and PM-5

Date: 07.07.2016
Contact: PNO
BU: DS (FPL)

Announcement of Discontinuance

VAT officially announces the discontinuance of our gate valve control system S64.2 DN160-400 with stepper motor and pressure controllers PM-4 and PM-5. VAT acknowledges the obligation to promptly inform our customers of the intent to exit products to enable our customers the ability to prepare for alternatives and/or assist in their product portfolio renewal process. Our intent is to support these products for a limited time in order to allow for future planning by all of our customers, therefore we will offer last time buy opportunities to support their needs.

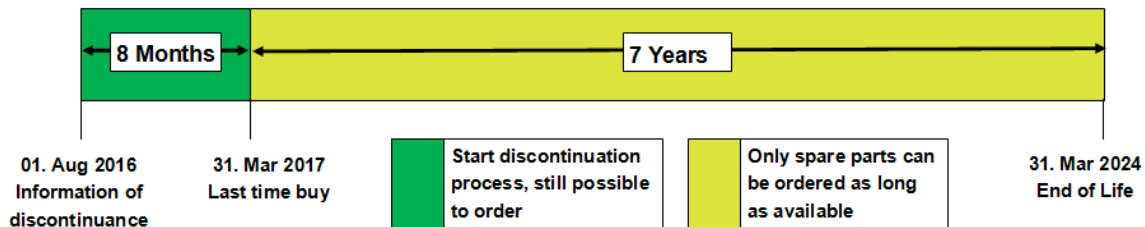

Reason for Discontinuance

After a long successful story since 1988, our gate valve control system with stepper motor gate valve S64.2 and the pressure controllers PM-4 and PM-5 has reached it's end of life. Optimization of VAT's product portfolio and the discontinuance of electrical components in controller make this decision necessary.

Last Time Buy

VAT grants a last time period for all customers to buy complete products and spares until the end of March 2017. After the 8 months period VAT will maintain the delivery of spare parts as long as parts are available.

Successor Product Gate Valve Control System S64.2IC

The S64.2 gate valve itself does not change mechanically. Only the stepper motor actuator and the controller will be replaced by a new state-of-the-art device. The new control unit is mounted upon the valve body and provides a big variety of interfaces including a much faster reaction time. An encoder for position detection and an integrated maintenance warning are just a few improvements compared with the discontinued PM-4 and PM-5 controllers.

The possibility to place the control unit externally and connect by an up to 5 m cable allows fully compatibility with the old system.

For further information please contact our local sales organization.
